## Body (particle)

**Shape** Sphere, Facet, ... 

**Material** ElastMat, FrictMat, 

**State** position, orientation, velocity, ...

**Bound** for approximate collision detection (**Aabb**)

## Generalized forces

## Interaction of 2 bodies

**InteractionGeometry** different for **Sphere+Sphere**,  
**Facet+Sphere**, ... 

**InteractionPhysics** internal state of interaction (plasticity  
variables, damage, history) 

# Functional components

using Yade

Past projects

Present  
projects

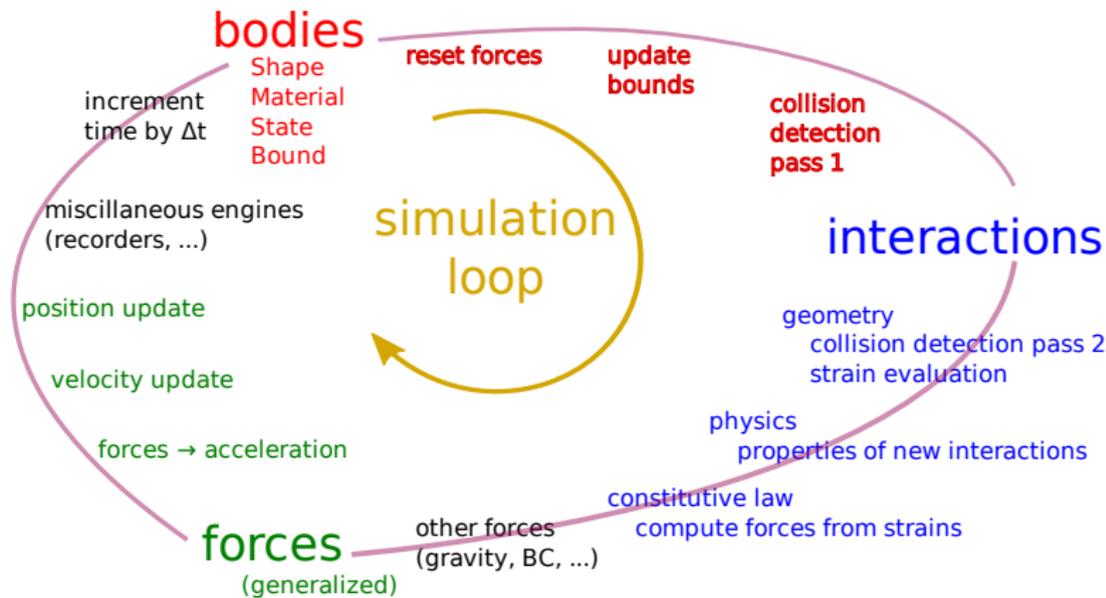

## Engines

- **GlobalEngine**  act on all bodies/interactions
- **PartialEngine**  act on some bodies/interactions
- **Dispatcher**  calls functions based on classes of arguments: e.g. **Facet+Sphere** needs different function than **Sphere+Sphere** collision

## Functors

Callable function-like objects. Accept only certain classes and are called by **Dispatchers**.

## BoundFunctor (Bo1)

approximate volume representation, for fast collision detection

## InteractionGeometryFunctor (Ig2)

resolves geometry of interaction (e.g. displacement, shear),  
based on **Shapes** of bodies

## InteractionPhysicsFunctor (Ip2)

derives properties of interaction, i.e. creates  
**InteractionPhysics** for given particles' **Materials**

## LawFunctor (Law)

resolves forces on particles, using **InteractionGeometry** and  
**InteractionPhysics** of some types, created by previous functors.

## Simulation data in code

```
O.materials.append(  
    FrictMat(young=30e9,poisson=.3,density=3000,frictionAngle=.5)  
)  
O.bodies.append([  
    utils.sphere((0,0,3),radius=1),  
    utils.facet([(-1,-1,0),(1,0,0),(0,1,0)])  
])  
O.dt=.5*utils.PWaveTimeStep()
```

## Running simulation

```
O.run(10000); O.wait()    # Basic simulation control  
O.save('/tmp/a.xml')  
print O.bodies[3].state.vel    # inspection of (c++) data  
print O.interactions[0,2].geom.normal  
print O.materials[0].young  
quit()
```

# “Meshing” volumes with spheres

See **horse** (surface import), **mill** (“by hand”)

## Volume representation

- Boundary: triangulated surface; imported (STL, GTS, gmsh) / created “by hand” (possibly parametric)
- Volume: constructive solid geometry, boolean composition

## Sphere packing generators (decoupled from volume)

- Import packing (text, LSMGenGeo)
- Dynamic: triax compression/decompression, gravity
- Geometric: from tetrahedron mesh (SpherePadder), from boundary specification (LSMGenGeo)

# “Meshing” volumes with spheres (2)

## Community

- **website, wiki, bugs** and **specifications** tracking
- responsive mailing lists for **users** and **developers**,  $\approx 10$  messages/day
- used at multiple institutes, mostly research

## Code

- central code **repository** with history
- **documented** code structure (in progress)
- documentation of **c++/python classes** and **python modules**
- Linux/Unix only

## Performance

- Shared-memory parallelism using **OpenMP**; speedup depending on scenario & machine,  $\approx 5\times$  on 8 cores.
- Profiling tools (**yade.timing**)

## Usability

- Batch scheduling and execution (parametric studies)
- Remote watching and control over http and telnet
- Debugging tools (**yade.log**), embedded debugger
- Embedded **ipython** shell
